

LB017013 :

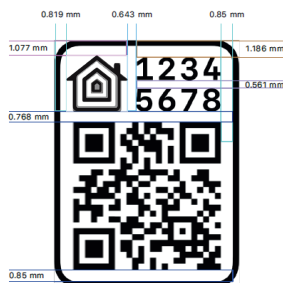

Parte impresa en control de producción:

- Pin de 8 dígitos único de cada producto. Texto 2 mm de altura y espacio entre línea y línea de 0.561 mm
- QR único de cada producto.
- Tipografía del texto debe ser SF Mono Bold
- Se fusiona esta pegatina con la C3000770 que llevaba el PIN y la MAC.

Indicaciones de Apple

Setup Code

Requirements

Each Licensed Product must include a setup code using a QR code or wireless logo when enabled with NFC.

A digital template for creating a setup code is available in the MFI Portal.

The setup code must be unique for each product. Whenever space allows, the setup code must be printed on the Licensed Product. If the setup code cannot be printed on the Licensed Product, a label should be applied. The setup code must also appear on the inside of packaging. Follow the print specifications provided on page 12 when displaying the setup code.

If the setup code cannot be printed on the Licensed Product in compliance with these specifications, place it only on the interior of the packaging, either printed in a visible area inside the package or printed on in-box literature such as manuals or instructions. The setup code must not be visible on the outside of product packaging.

Creating the setup code

Whenever space allows, the standard setup code must be used on the product and in packaging literature. An alternate setup code can be used only when there isn't enough room for the standard code.

The setup code must be accompanied by eight numerals above it in the SF Mono Bold font in black color only. Center the numerals and setup code within a rectangular box with a white or transparent background defined by a black linear border. You can refer to the code in instructions as "HomeKit setup code."

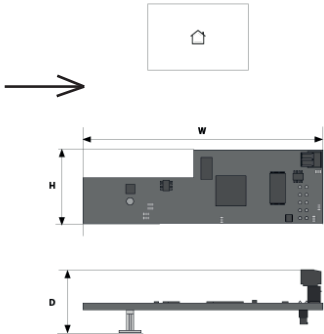

Comply with the print specifications shown on page 12 when creating artwork for the setup code and surrounding box. The setup code can be scaled larger, but it must not be scaled smaller than the minimum print specifications.
